

Acceptance Testing

UAT Execution & Report Submission

Field	Details
Date	03 October 2026
Team ID	SWTID-2026-6228
Project Name	Import Data using Transform Maps (Spreadsheet)
Maximum Marks	4 Marks

1. Purpose of Document

The purpose of this document is to briefly explain the test coverage and UAT results of the Import Data using Transform Maps (Spreadsheet) project. The solution imports employee data from a spreadsheet into a ServiceNow Import Set Table, validates and transforms it into the Employee Test target table, and prevents duplicate records using Coalesce.

2. Defect Analysis

This report shows the validation status of the employee import workflow and how data conditions are handled during transformation.

Resolution / Validation	Expected Behavior	Result
Valid Data	Employee ID, Name, Email, Department and Location are mapped correctly.	Pass
Existing Employee ID	Existing employee record is updated with new values.	Pass
New Employee ID	A new employee record is inserted.	Pass
Duplicate Import	Repeated data does not create duplicate employee records.	Pass
Transform Error	Incorrect/incomplete records can be identified during validation.	Pass

3. Test Case Analysis

This report shows the main test cases performed for spreadsheet loading, transformation, Coalesce, validation and final employee records.

Section	Total Cases	Not Tested	Fail	Pass
Spreadsheet / Load Data	1	0	0	1
Import Set Table	1	0	0	1
Transform Map & Field Mapping	2	0	0	2
Transform Data & Validation	2	0	0	2
Coalesce / Duplicate Prevention	3	0	0	3
Reports & Dashboard	2	0	0	2

4. Import Set Table & Transform Map Validation

The spreadsheet data is uploaded through Load Data into the Employee Import staging table. The Transform Map named “Sample Spreadsheet Import” uses Employee Import as the source table and Employee Test as the target table. Auto Map Matching Fields is used to map the employee fields.

Source Field	Target Field	Coalesce
Employee ID	Employee ID	True
Employee Name	Employee Name	False
Email	Email	False
Department	Department	False
Location	Location	False

5. Transform Data / Coalesce Result

A new spreadsheet containing four rows was uploaded. Two rows contained existing Employee IDs with changed Name/Email values, and two rows contained new Employee IDs. Employee ID was enabled as the Coalesce field.

Uploaded Records	Inserted	Updated	Ignored
First Coalesce test – 4 rows	2	2	0
Same spreadsheet uploaded again – 4 rows	0	0	4

The first run inserted the two new employee IDs and updated the two existing employee records. When the same spreadsheet was uploaded again, no duplicate records were created and all four records were ignored because the corresponding data already existed without further changes.

6. Reports & Dashboard

Reports were created from the Employee Test table and added to the Employee Analytics Dashboards.

Report / Dashboard	Configuration / Purpose	Status
Employees by Department	Pie chart grouped by Department with Count aggregation.	Pass
Employees by Location	Shows employee distribution by Location.	Pass
Employee List Report	Displays employee records from Employee Test.	Pass
Employee Analytics Dashboards	Combines the three reports in one centralized view.	Pass

7. Final Report Output

All required employee records were successfully imported into the ServiceNow Employee Test table through the Import Set and Transform Map. The Coalesce configuration correctly handled existing and new Employee IDs and prevented duplicate records.

8. Conclusion

This project successfully implemented an automated employee data management solution using ServiceNow Import Sets and Transform Maps. The Import Set Table provides temporary staging, the Transform Map transfers data to the Employee Test table, and Coalesce maintains data integrity by updating existing employees instead of inserting duplicates. Reports and the Employee Analytics Dashboard provide centralized visibility into employee information.
